D126 | A fresh tree, not a real pilot

PRIVATE FICTIONAL cumulative review. All money crore INR at one common valuation date. Gross300/20 less scale80 yields net220/-60. No actual pilot, investment, purchase, contact, disclosure or spend.

Attempt independently	Construct the joint tree, Bayes posteriors, actions and acquisition-cost sensitivity before reference. The original25-question review is intact. A risk-neutral expected-money criterion and no financing constraints are stipulated, not actual feasibility or approval.
Fresh baseline	Prior good.4, sensitivity.9 and specificity.9. Positive joint.36/.06 =>.42 and posterior6/7. Negative joint.04/.54 =>.58 and posterior2/29. Scale EV after negative -40.689655; stop0. Positive scale EV180. Threshold3/14; ties explicit.
Ex ante versus node	Best no-pilot52; gross optimal pilot75.6;EVSI23.6;acquisition6 gives net69.6 and improvement17.6. Perfect-info88;EVPI36. At negative node acquisition6 is already sunk in BOTH actions: lifetime scale -46.689655 versus stop -6, same forward difference -40.689655.
Signal quality test	Set positive rates.6 if good and.4 if bad, meaning sensitivity/specificity.6. Both posteriors.5 and4/13 exceed threshold: scale after both, gross EV52,EVSI0 and net46 after6. Informative does not guarantee positive decision value.
No mixed cases	Cumulative review compares each earlier case using its own dates, currencies, denominators and conventions. Do not pool Day120 contribution, Day121 forecast loss, Day123 proper score or Day125 share into a pilot payoff.
Authority and learning	Actual response details, not aggregate score, support targeted retry. Preserve pre-outcome forecasts and source versions. Actual learner, review and transfer records blank. No real confidential forwarding or capital allocation. Static prose Case-v1; revise after edits. No overall10 or account clearance.

Inputs | Fixed state, optional information

Synthetic probabilities and NET terminal present values. Stop payoff fixed0. Success payoff>=0, failure<=0, at least one strict. Costs nonnegative and paid once when test acquired.

Prior success probability	0.40
Scale success net payoff, crore INR	220.00
Scale failure net payoff, crore INR	-60.00
Positive signal probability given success	0.90
Positive signal probability given failure	0.10
Acquisition cost, crore INR	6.00
Separate PV delay/opportunity cost, crore INR	0.00

Decision model inputs valid? (1=yes)	1.000000
Test costs valid? (1=yes)	1.000000

Valid numerical bounds do not verify empirical priors, likelihoods, project cash flows or risk capacity. Costs are separate from terminal values only by explicit assumption. If a pilot changes state, performance, cash flows or available actions, rebuild the causal model.

Joint tree | Multiply then condition

Joint = prior state probability times signal likelihood. Each column is one mutually exclusive signal. Impossible signal has undefined posterior, not zero success probability. No rounded posterior feeds the model.

Joint probability	Positive signal	Negative signal
Success joint	36.0000%	4.0000%
Failure joint	6.0000%	54.0000%
Marginal signal probability	42.0000%	58.0000%
Posterior success, if signal possible	85.7143%	6.8966%
All joint probabilities sum	1.000000	

Baseline positive .36+.06=.42, posterior6/7. Negative .04+.54=.58, posterior2/29. Signal rates are assumed conditional probabilities, not measured accuracy. Zero-probability branches carry zero weighted value and no chosen action.

Foldback | Preserve scale and stop

Conditional EV before acquisition/delay costs. Fixed stop0. Zero-probability signal is UNREACHED; no division by zero. Weighted optimal branch value uses joints directly for stability.

Measure	Positive signal	Negative signal
Conditional scale EV, crore INR	180.000000	-40.689655
Optimal action before test costs	SCALE	STOP
Weighted optimal payoff, crore INR	75.600000	0.000000
Prior scale EV, crore INR	52.000000	
Best no-test EV, crore INR	52.000000	
No-test action	SCALE	
Scale break-even success probability	21.4286%	
Gross optimal with-signal EV	75.600000	

Baseline no-pilot52; positive SCALE180/negative STOP0; weighted75.6. Costs are sunk at signal time but matter when deciding whether to acquire. Tie means either scale or stop yields the same EV under the stated criterion, not identical downside.

Value | Gross information versus net gain

All amounts crore INR at the same valuation date. Delay is separately given present value, not a new discount rate. Gross EVSI/EVPI independent of acquisition cost in this fixed model.

Gross expected value of sample information	23.600000
Gross optimal payoff with perfect information	88.000000
Expected value of perfect information	36.000000
Acquisition plus delay, paid once	6.000000
Net test-policy EV	69.600000
Net gain versus best no-test	17.600000
Acquisition cost ceiling with fixed delay	23.600000
Acquire under EV criterion?	PREFER TEST
Gross bounds 0<=EVSI<=EVPI? (1=yes)	1.000000

A negative cost ceiling means even a free acquisition is inferior once stated delay is paid. Equality is a net-EV tie, not approval. Positive EVSI alone does not justify purchase. EVSI can equal EVPI for perfect or decision-equivalent sample information; zero EVSI is possible.

Too late | Scale already irrevocable

A separate specified decision: scale was committed, both terminal payoffs and all later actions fixed. Information only changes beliefs. It cannot be credited with an unspecified future use.

Committed scale EV before test	52.000000
Committed scale EV with free information	52.000000
Information decision value after commitment	0.000000

Committed EV after paid test and delay	46.000000
Change caused by acquisition costs	-6.000000

If prior scale EV becomes negative in a changed case, the committed path keeps that negative value: it cannot silently choose stop. Compare this path to its own no-information committed baseline, not the still-reversible best no-test policy. Baseline52 ->46 after6+0. This committed-path example is separate from the negative-result node, where stop remains available.

Audit | Algebra is not an approval

Independent gross and cost checks. Bad costs do not erase valid gross information arithmetic. Broken critical references hold affected summaries. No empirical signal calibration or real authority is verified.

Gross joint/foldback identities valid? (1=yes)	1.000000
Guarded EVSI, crore INR	23.600000

Net cost identities valid? (1=yes)	1.000000
Guarded net gain, crore INR	17.600000

Tests cover defined identities, not every possible formula corruption. Valid arithmetic cannot establish real payoffs, independent signal rates, permission, risk acceptance or a worthwhile pilot. Separate source evidence and authority would be needed for actual activity.

Negative node | Paid pilot is sunk in both actions

Baseline negative branch is possible. Compare forward actions, then show acquisition cost once in BOTH lifetime alternatives. Do not force scale to recover a sunk6. Units crore INR; same valuation date.

Forward scale EV after negative	-40.689655
Lifetime scale EV including paid pilot	-46.689655
Lifetime stop EV including paid pilot	-6.000000
Lifetime scale minus stop	-40.689655
Action after negative	STOP

Baseline scale -40.689655 versus stop0 forward; lifetime -46.689655 versus -6. Same difference. An impossible negative signal is UNREACHED, not a real decision or zero posterior. A paid cost affects the ex-ante acquisition choice but not this forward comparison.

Cumulative review | Keep the cases separate

FOR REVIEW ONLY. These are reference prompts, not observed mistakes, reviewer acceptance or a diagnosis of any learner. Use actual item responses before choosing a retry.

Day120 and121	DiD arithmetic remains conditional on a substantive untreated-counterfactual assumption; equal earlier pretrends do not prove it. Forecasts use past-only horizon-matched evaluation; stockout sales are a lower bound on demand, not exact error. Lower RMSE need not minimize stated inventory loss.
Day122 and123	Information must arrive before a relevant reversible decision; net value includes costs. Duplicate newsletters do not create independent likelihood ratios. Freeze pre-outcome forecasts; one-coordinate versus two-coordinate Brier convention changes scale, not realized forecast quality.
Day124 and125	Use corrected value with comparable net BATNA. Common sunk cost belongs in both alternatives. Relative share needs comparable largest-other-rival denominator; included subsidiary cannot be added twice. Portfolio externality and feasible substitute can change a pet decision.
Actual-response gate	An aggregate60% score cannot identify which questions were missed. Record actual question, chosen answer, reasoning and evidence; then select a targeted correction. Never fill this log from a synthetic scenario or invent an actual error.
Fictional day0 owner	Model owner checks units, joint denominators and signal calibration. Governance owner preserves contradictory confidential evidence, stops relying on false assertions and seeks authorized diligence/legal review. No real owner, recipient, role, NDA or law established.
Fictional day7 owner	Independent reviewer asks for a fresh-context tree, revises payoff assumptions if the pilot changes outcomes, and records only performed review/transfer. Do not edit frozen forecasts after resolution or forward confidential results automatically.

Evidence | Selected written support

Written text rechecked13 November2026. Not full visual diagrams, interactive media or audiovisual coverage. Fictional prior and signal rates stipulated, not extracted venture-success base rates.

Joint and value source	https://cushman.host.dartmouth.edu/courses/engs41/Value-of-info.pdf - Bayes reversal, foldback and net sampling gain. Dated teaching oil example is not this fresh two-state pilot.0<=EVSI<=EVPI permits equality; positive EVSI alone does not justify positive-cost acquisition.
Conditional-probability source	https://online.stat.psu.edu/stat509/lesson/17/17.3 - sensitivity, specificity and prevalence determine post-test values. Medical sample and rates are not venture evidence. Specificity.9 means positive-given-bad.1, not posterior-good.9.
Prior reviewed scope	Day123 proper-score/duplicate evidence, Day124 negotiation and Day125 portfolio material retain their recorded source coverage and unresolved limits. No new full-law, current-market-share, financial-filing or empirical learner claims made by this cumulative exercise.
Pure-information assumption	If pilot changes quality, demand, timing, financing, costs or available actions, rebuild the causal payoff model. Do not call all payoff improvement information value. Gross300/20 minus scale80 already gives net220/-60; do not subtract80 again.
Permission hold	Classroom EV does not authorize a pilot, purchase, scale-up, investment, accusation, confidential forwarding or contact. Missing actual evidence or authority holds action. No real participant, technical calibration, account testing or legal clearance.
Validation scope	Native arithmetic and controlled inputs tested in authored LibreOffice only. Not Excel/Sheets parity, independent learner mastery, real response-level diagnosis, full source or video coverage, account flow or overall10/10. Static reference Case-v1; actual records remain blank.

Actual work | No observed pilot or learner record

Record only actual work performed, not synthetic outcomes as realized results. Blank fields are not zeros or approval.

Actual date/version	Actual question and response	Posterior/action error	Targeted retry and evidence	Objection/evidence	Revised decision	Delayed transfer

Actual work remains blank. Record only what occurred: dates, reasoning, error/source/correction, strongest objection and a new delayed transfer. No invented learner results, sponsor acceptance, actual budget release or signed rights.

Failure log | Authored execution only

Observed native tests are added only after execution. Not actual learner mistakes, independent human audit, Excel/Sheets parity, real authority or overall 10/10.

Controlled test	Observed authored outcome
Baseline joint/posterior/foldback	PASS:baseline joint/posterior/optimal foldback and value formulas independently checked.
Changed priors and payoff boundaries	PASS:changed priors0/1/interior, payoffs including zero endpoints.
Informative/inverted/perfect/zero signals	PASS:perfect, inverted, uninformative and impossible-signal cases.
Cost tie, high cost and delay	PASS:costs high/zero, delay, negative ceiling and exact cost tie.
Impossible signal undefined branch	PASS:zero-probability posterior UNDEFINED/action UNREACHED, weighted0.
Invalid models/cost isolation	PASS:16 invalid cases held; bad costs preserve gross arithmetic.
Broken critical references/holds	PASS:7 broken critical references held affected summary.
Restored baseline/actual work blank	PASS:24 changed sets+restore; actual learner fields blank.

Only the original synthetic course exercise at https://top1os.dev/ supplies the case figures. No new empirical reading, real participants, company records, Indian legal clearance, actual commitments or source completeness claimed.
