D104-D105 | Conditional is not certain

PRIVATE SYNTHETIC common-equity and independent mixed-review cases, crore INR. Original exercises retained. No actual loan, investment, term sheet, customer evidence, data access or permission.

Attempt before reference	D104 staged technical/commercial tree is separate from D105 debt, terminal and startup problems. Do not add their cash, probabilities or values. Work without notes, state assumptions, then compare. Actual attempts and delayed transfer remain blank.
D104 | State and date	Time 0 cheque 2 buys 20% at pre 8. Technical pass at year 1 has probability .4; conditional commercial pass at year 3 is .5. Joint positive exit .2. Technical fail .6, pass/commercial fail .2, both pass .2 exhaust the tree.
D104 | Ownership and policy	Only technical pass triggers total round 4 at pre 12. No-follow-on leaves 15%; optional fund 1 WITHIN round 4 gives 21.25%, outside 3. Common-equity exit 80 on commercial success gives 12 or 17. Equity exit already after obligations, not enterprise value.
D104 | Hurdle and choice	Stipulated expected-cash annual hurdle 20%, not a market estimate or duplicate explicit failure penalty. No-follow-on time 0 NPV -.611111; follow-on policy -.365741. Conditional time 1 increment .736111 is positive while both original time 0 policies remain negative.
D105 | Independent mixed cases	Debt cover 3x does not fund principal maturity; base endpoint -4/floor gap 6. Terminal begins year 3, reinvestment included. Separate startup positive NPV .041667 turns -.218750 when conditional commercial probability falls .4 to .3.
Limits and actual evidence	All probabilities, prices, dates and thresholds are stipulated fictional inputs. Structural/arithmetic checks do not verify forecasts, financing availability, real rights or mastery. Static prose is Case-v 1; revise it when inputs change. No automatic investment recommendation or capital release.

D104 inputs | Conditional probabilities and dates

Crore INR. Year 0/1/3 dates fixed for this exercise. All inputs fictional. No preferences, debt, tax, fees, salvage, extra dilution or other distributions.

Time 0 initial fund cheque	2.00
Entry pre-money common equity	8.00
Technical pass probability at year 1	0.40
Commercial pass conditional on technical pass	0.50
Year 1 pre-money on technical success	12.00
TOTAL year 1 round, including fund	4.00
Optional fund cheque WITHIN total round	1.00
Year 3 commercial-success equity exit	80.00
Annual effective expected-cash hurdle	0.20

Inputs structurally valid? (1=yes)	1.000000

A validity flag checks this simplified model only. Zero probabilities allowed; undefined ratios stay #N/A. Negative calculated cash/NPV remains visible, not discarded. Missing/text/out-of-range inputs block affected numeric outputs. Actual rights, empirical probabilities and complete cash timing remain UNKNOWN.

D104 ownership | Inclusive round

Common equity only. Fund follow-on is part of total round, not extra to it. Fractions are of company post-money, not of round funding.

Entry post-money	10.000000
Entry fund ownership	20.0000%
Year 1 post-money	16.000000
Old equity retention fraction	75.0000%
Fund no-follow-on ownership	15.0000%
Fund new ownership from optional cheque	6.2500%
Fund total ownership with follow-on	21.2500%
Other investors cash within total round	3.000000
No-follow-on success proceeds	12.000000
Follow-on success proceeds	17.000000
Extra success proceeds	5.000000

Baseline 20% entry, old stake retained 75%, no-follow-on 15%, fund increment 6.25%, total 21.25%. No automatic allocation or participation right. Fund 1 plus outside 3 = TOTAL4. No outside 4 plus fund 1 path silently substituted. Values are conditional on stated events, not guaranteed payoffs.

D104 branches | Exhaustive, not added success rates

Crore INR, year 0/1/3. Probabilities conditional as labeled. Technical failure has no later financing or proceeds; a decision policy is not a realized outcome.

Joint event	Probability	Year 0 both	Year 1 no-follow	Year 1 follow	Year 3 no-follow	Year 3 follow
Technical fail	60.0000%	-2.000000	0.000000	0.000000	0.000000	0.000000
Technical pass, commercial fail	20.0000%	-2.000000	0.000000	-1.000000	0.000000	0.000000
Technical and commercial pass	20.0000%	-2.000000	0.000000	-1.000000	12.000000	17.000000
Sum probabilities, must equal 1	1.000000					
Branch/model identities valid?	1.000000					

Probabilities .6/.2/.2 sum 1. The year 1 cheque is paid on BOTH technical-success branches, not only commercial success. Every branch pays original 2 at year 0. Both technical-success branches later split with conditional commercial probability. Missing terms/salvage/funding would require a new explicit model.

D104 policies | State, date and expected value

Crore INR. Expected cash rows weight exhaustive branches. Conditional time 1 option increment excludes sunk time 0 cost. Neither positive option value nor funding availability authorizes actual exercise.

Measure	No follow-on	Optional follow-on
Expected year 0 investor cash	-2.000000	-2.000000
Expected year 1 investor cash	0.000000	-0.400000
Expected year 3 investor cash	2.400000	3.400000
Time 0 expected NPV at stated hurdle	-0.611111	-0.365741
Time 0 incremental policy NPV	0.245370	
Conditional time 1 follow-on increment	0.736111	
Same increment weighted back to time 0	0.245370	
Increment identity residual, expected 0	0.000000	
Expected gross proceeds / original cost, NO follow	1.200000	

Baseline no-follow NPV -.611111; optional policy -.365741; increment .245370 =.4/1.2 times conditional time 1 .736111. The 1.2x expected gross ratio is not realized MOIC/IRR or fund net performance. When technical probability 0, the conditional option calculation is hypothetical at an unreachable node; time 0 increment remains 0.

D105 inputs | Three separate cases

Three independent fictional cases, crore INR. Negative calculated cash/NPV allowed. Annual debt period 1; terminal starts year 3; startup year 0/1/3. No cash flows or values are added across cases.

Debt opening cash before expansion	8.00
New debt at time 0, due year 1	12.00
Expansion paid time 0	16.00
Annual EBIT	9.00
Annual depreciation	2.00
Annual working capital increase	3.00
Total paid interest, already includes existing	3.00
Annual maintenance capex	1.00
Proposed cash floor	2.00
Separate collection delay / added AR	2.00
Terminal year 2 NOPAT	12.00
Terminal WACC, matched nominal annual	0.09
Terminal growth	0.03
Terminal ROC	0.09
Startup initial cheque	1.00
Startup entry pre-money	4.00
Startup technical pass	0.50
Startup conditional commercial pass	0.40
Startup year 1 pre-money	9.00
Startup outside round	3.00
Startup year 3 equity exit	60.00
Startup expected-cash hurdle	0.20

Debt inputs valid? (1=yes)	1.000000
Terminal inputs valid? (1=yes)	1.000000
Startup inputs valid? (1=yes)	1.000000

Each case has its own structural flag. Debt, terminal and startup cases stay independent. Undefined cover at zero interest is not zero cover. These are not financing terms or market probabilities.

D105 debt | Interest cover is not maturity cash

One year, crore INR, no tax/other flows. Total interest 3 is already complete. Principal 12 due year-end, not an annual interest charge. Collection delay affects AR/cash, not EBIT.

Cash after time 0 expansion	4.000000
Annual pre-principal cash	4.000000
EBIT / total interest	3.000000

Year-end cash after principal	-4.000000
Endpoint additional funding to floor	6.000000

Delayed collection annual movement	2.000000
Delayed collection ending cash	-6.000000
Delayed endpoint funding to floor	8.000000

Base cover 3x/pre-principal 4/end-4/floor gap 6. Separate delay 2 gives movement 2/end-6/gap 8, cover remains 3x. Endpoint funding need is not exact intrayear maximum, a loan offer, certain refinancing, or authority. Debt principal is not subtracted twice from annual operating movement.

D105 terminal | Match numerator and reinvestment

Crore INR. Year 2 NOPAT fixed; terminal begins year 3. Matched nominal WACC/growth/ROC are stipulated, not market rates. Terminal PV is not whole enterprise value.

Next-period year 3 NOPAT	12.360000
Reinvestment fraction g/ROC	33.3333%
Year 3 reinvestment	4.120000
Year 3 FCFF	8.240000

Terminal value at end year 2	137.333333
Time 0 PV of terminal only	115.590719

Misquoted TV, no reinvestment	206.000000
Overstatement from omitted reinvestment	68.666667

Base next NOPAT 12.36/reinvestment 4.12/FCFF 8.24/end-year 2TV137.333333/PV 115.590719. Separate g 5%, prior NOPAT 12 fixed, gives next 12.6/reinvestment 7/FCFF 5.6/TV 140. With ROC=WACC, invariance to growth requires SAME NEXT-period earnings basis; holding prior NOPAT fixed differs. Growth>=WACC invalid for this stable model.

D105 startup | New case, not the D104 option

Crore INR; separate year 0/1/3 no-follow-on case. Common equity, zero failure proceeds, no extra claims/fees/tax/debt or salvage. No probability is measured business evidence.

Initial stake	20.0000%
Retained fraction after outside round	75.0000%
Final original fund ownership	15.0000%

Joint positive exit probability	20.0000%
Success-only investor proceeds	9.000000
Expected year 3 investor proceeds	1.800000

Time 0 expected NPV	0.041667

Base entry 20%, final 15%, joint 20%, success 9/expected 1.8/NPV+.041667. Separate conditional commercial .3 gives joint 15%/expected 1.35/NPV-.218750. Retain contradiction, revise affected decision. Positive narrow NPV neither proves technology/demand nor authorizes investment. No follow-on is supplied in D105.

Evidence | Inputs are not empirical probabilities

Original D104/D105 written exercises at https://top1os.dev/ supply the synthetic inputs. No new empirical reading or full audiovisual review is claimed by this native artifact.

Index | D104	Stage inputs -> Ownership -> Branches -> Policies. All money crore INR and declared years 0/1/3. Technical pass .4/commercial conditional .5/exit 80/rate 20% are authored assumptions. Historical survival tables are not measured probabilities for this venture.
Index | D105	Mixed inputs -> independent Debt, Terminal, Startup. No summing of their money or probability. Defined exclusions matter. Native formula execution does not validate the claimed completeness of any real cash schedule, financial statements or instrument.
Strongest authored objection	A milestone may be technically weak, probability estimates optimistic and new funding unavailable. A positive conditional follow-on value can coexist with negative time 0 NPV. Response: keep assumptions explicit, test coherent revised scenarios and do not claim commercial success or owner authority.
Day 0/30 | Scope and evidence roles	Verify actual instrument/source/rights before any affected real work. Technical and demand roles would need permitted validation designs, denominators and contrary outcomes. Fictional gates never authorize real tests, customer contact, disclosure, loans or investment.
Day 60/90 | Finance and review roles	Rebuild full dated cash, funding/terms/dilution, cost and probability evidence. Preserve original claim, contradictory packet, affected cells, conditional decision and actual reviewer words only if obtained. A passing audit or mock acceptance never releases funds.
Delayed transfer, not recognition	D104 lower conditional commercial probability; explain both option and original-investment values. D105 independently delay collections, change growth numerator basis, lower conditional success. Record actual new reasoning/errors later. App day score cannot diagnose question-level weakness or prove transfer.

Actual work | Leave unperformed results blank

Actual learner responses, confidence, observed errors, review and changed-context delayed tests only if performed. No reviewer, sponsor, learner or real authority is supplied.

Actual date / case	Attempt / confidence	Source / input / uncertainty	Error cause / original claim	Correction / decision change	Strongest objection / response	Delayed new context / actual result

Actual work remains blank. Record only what occurred: dates, reasoning, error/source/correction, strongest objection and a new delayed transfer. No invented learner results, sponsor acceptance, actual budget release or signed rights.

Failure log | Authored execution only

Observed native tests are added only after execution. Not actual learner mistakes, independent human audit, Excel/Sheets parity, real authority or overall 10/10.

Controlled test	Observed authored outcome
Baseline stages and mixed cases	PASS: all baseline cells independently recalculated from input values.
Commercial probability transfer / restore	PASS: commercial .3 changes both policy NPVs and conditional value; restored.
Inclusive follow-on 0 / restore	PASS: zero follow-on makes both policies equal; restored.
Technical probability 0 / restore	PASS: technical 0 leaves time0 increment 0, not a realized conditional option; restored.
Debt collection delay / restore	PASS: collection delay 4 changes cash, not EBIT cover; interest 0 leaves cover undefined.
Terminal growth 5% / restore	PASS: growth 5% changes numerator/reinvestment/TV 140 with prior NOPAT fixed.
Startup commercial 30% / restore	PASS: startup commercial 30% reverses NPV; zero cheque returns zero cash/NPV.
Invalid inputs / broken reference	PASS: twelve invalid input cases, independent-case isolation and broken stage/terminal refs.
Actual attempts blank / baseline restored	PASS: all baseline restored; actual attempt/error/reviewer/delayed evidence remains blank.

Only the original synthetic course exercise at https://top1os.dev/ supplies the case figures. No new empirical reading, real participants, company records, Indian legal clearance, actual commitments or source completeness claimed.
