D113-D114 | Quotes, units and dated branches

PRIVATE FICTIONAL importer annual rupees and separate equity million INR/USD. Not actual FX, customs law, tariff advice, a country premium, investor cash flows or authority.

Attempt before reference	Build the quote/tariff-base/contribution bridge and dated branch PV without notes before looking at results. Keep annual importer rupees separate from equity million USD. Actual attempts/errors/reviewer words/delayed transfer remain blank.
D113 | Quote and cost	USD 100 at INR 80/USD, tariff 10% on converted supplier invoice only, domestic 400 outside base: landed 9200. New FX 88/tariff 20% gives 10960. Quote rises 10%; reciprocal USD/INR falls 9.090909%, not 10%. FX-first attribution 880+880=1760; reverse order 800+960, same total.
D113 | Unit margin versus total	Old 11000 price/1000 units gives 1800000 contribution; new 12000/900 gives 936000, down 48%. At fixed 900 units, price 12960 preserves old total;12760 preserves only per-unit 1800 margin and gives 1620000. Required price is not proved demand.
D114 | Dated USD branch cash	Initial 800 million INR at 80 gives 10 million USD. Payoff 960 at time 1/FX 88 gives on-time PV 10.101010 at stipulated USD 8%. Delay to time 2/FX 96.8 gives 8.502534. Delay probability 25% gives expected PV 9.701391 / NPV -0.298609.
D114 | Risk is not removed by probabilities	Deterministic FX growth 10% and USD rate 8% imply matching INR 18.8% under this algebraic convention. It is not covered interest parity or a forecast. Expected branch timing can coexist with priced systematic risk; only a second identical delay penalty duplicates this particular modeled loss.
Scope and stop	Static reference prose is Case-v 1 and needs revision after edits. Authored native execution is not Excel/Sheets parity, source/full audiovisual/learner/account/legal clearance or overall 10/10. No shipment, supplier contact, FX trade, investment, transfer, borrowing, disclosure or spend authorized.

D113 inputs | Explicit tariff base

One annual window, all units purchased equal sold. Supplier invoice USD per unit; quote INR per USD; domestic rupees per unit outside the synthetic tariff base.

Supplier invoice, USD per unit	100.00
Old FX quote, INR per USD	80.00
New FX quote, INR per USD	88.00
Old synthetic tariff rate (fraction)	0.10
New synthetic tariff rate (fraction)	0.20
Domestic distribution, rupees per unit	400.00
Old selling price, rupees per unit	11000.00
New selling price, rupees per unit	12000.00
Old annual units	1000.00
New annual units	900.00
Separate downside annual units	750.00

Structural inputs valid? (1=yes)	1.000000

Yellow cells are fictional assumptions, not observed data or permission. A structural pass does not establish current source definitions, demand, contractual terms, economic feasibility, liquidity or real authority.

D113 results | Revenue is not contribution

Rupees per unit and total annual rupees, not crore or equity million. FX-only is a controlled cost counterfactual with old price / volume/tariff, not an observed market response.

Measure	Old	FX only	New	Downside
Converted supplier invoice, INR/unit	8000.000000	8800.000000	8800.000000	8800.000000
Synthetic tariff, INR/unit	800.000000	880.000000	1760.000000	1760.000000
Domestic cost outside tariff, INR/unit	400.000000	400.000000	400.000000	400.000000
Landed cost, INR/unit	9200.000000	10080.000000	10960.000000	10960.000000
Selling price, INR/unit	11000.000000	11000.000000	12000.000000	12000.000000
Per-unit contribution, INR/unit	1800.000000	920.000000	1040.000000	1040.000000
Annual units purchased = sold	1000.000000	1000.000000	900.000000	750.000000
Annual revenue, INR	11000000.000000	11000000.000000	10800000.000000	9000000.000000
Annual variable cost, INR	9200000.000000	10080000.000000	9864000.000000	8220000.000000
Annual contribution, INR	1800000.000000	920000.000000	936000.000000	780000.000000
Contribution change vs old, INR	0.000000	-880000.000000	-864000.000000	-1020000.000000
Contribution percentage change vs old	0.0000%	-48.8889%	-48.0000%	-56.6667%
Landed percentage change vs old	0.0000%	9.5652%	19.1304%	19.1304%
INR/USD quote percentage change vs old	0.0000%	10.0000%	10.0000%	10.0000%
Reciprocal USD/INR percentage change	0.0000%	-9.0909%	-9.0909%	-9.0909%
Incremental cost pass-through, price/cost change	Not applicable	0.0000%	56.8182%	56.8182%
Price to match OLD per-unit margin, INR/unit	11000.000000	11880.000000	12760.000000	12760.000000
Price to match OLD total at stated volume	11000.000000	11880.000000	12960.000000	13360.000000

Baseline cost 9200 ->10960, contribution 1800000 ->936000; downside 780000. Price increase 1000 recovers 56.818182% of cost increase 1760, not a demand elasticity. Zero old contribution blocks percentage comparison; zero volume blocks total-preserving price. Cost-change zero blocks pass-through. No fixed cost/capex/tax/stock/cash timing, so not full profit or NPV.

D113 attribution | Sequence allocates the interaction

All values INR per unit. Both sequences use the exact same supplier/domestic inputs and start/end costs. Do not add the cross term twice.

Measure	INR per unit
FX first, old tariff retained	880.000000
Tariff second, NEW FX invoice base	880.000000
FX-first total landed change	1760.000000
Tariff first, old FX invoice base	800.000000
FX second, NEW tariff retained	960.000000
Tariff-first total landed change	1760.000000
Cross interaction, not an extra total charge	80.000000
Order totals minus direct landed difference	0.000000

Baseline FX-first 880+880=1760; tariff-first 800+960=1760; interaction 80 is embedded, not an extra charge. This toy tariff excludes domestic distribution by stipulation. Actual customs valuation/rates/effective dates/tax recovery would need original current documents.

D114 inputs | Dated equity, no debt

Million INR/USD, nominal amounts and a stipulated expected-equity-cash hurdle. Deterministic FX path is for algebraic currency consistency only, not a traded forward or risk-free path.

Initial time-zero equity outlay, million INR	800.00
Spot FX quote, INR per USD	80.00
Same terminal equity payoff, million INR	960.00
Annual rise in INR/USD quote (fraction)	0.10
Stipulated nominal USD annual hurdle (fraction)	0.08
Probability of delay branch	0.25
On-time payoff date, years from time zero	1.00
Delayed payoff date, years from time zero	2.00
Diagnostic SECOND haircut for SAME delay (fraction)	0.25

Structural inputs valid? (1=yes)	1.000000

Yellow cells are fictional assumptions, not observed data or permission. A structural pass does not establish current source definitions, demand, contractual terms, economic feasibility, liquidity or real authority.

D114 branches | Convert at date, then discount

No debt, interim distribution, default, fees, taxes, extra capital or compensation. Branch CAGR is not expected portfolio IRR. Diagnostic haircut is labelled SAME delay already modeled, not a recommended risk adjustment.

Measure	On-time branch	Delayed branch
Payoff date, years from time zero	1.000000	2.000000
Terminal equity proceeds, million INR	960.000000	960.000000
Dated FX quote, INR per USD	88.000000	96.800000
Terminal proceeds, million USD	10.909091	9.917355
Branch probability	75.0000%	25.0000%
USD compound discount factor	1.080000	1.166400
Branch PV, million USD	10.101010	8.502534
Branch NPV, million USD	0.101010	-1.497466
Local total return over branch horizon	20.0000%	20.0000%
USD total return over branch horizon	9.0909%	-0.8264%
Local annualized branch CAGR	20.0000%	9.5445%
USD annualized branch CAGR	9.0909%	-0.4141%
Currency-matched nominal INR annual rate	18.8000%	18.8000%
Local PV, million INR	808.080808	680.202700
Local PV / spot, million USD	10.101010	8.502534
Currency consistency residual, million USD	0.000000	0.000000
DIAGNOSTIC repeat-same-delay haircut PV	7.575758	6.376900
Extra duplicate PV reduction, million USD	2.525253	2.125633

Baseline USD on-time return 9.090909%, PV 10.101010; delayed PV 8.502534. INR matched 18.8%, not 18%. Delay local CAGR 9.544512% and USD CAGR -0.414081%. Expected cash-flow probabilities do not make cash certainty-equivalent or erase systematic risk. A separately justified premium may coexist; the shown identical second loss duplicates that loss only.

D114 summary | Expected cash is not certainty-equivalent

Only this one equity claim, million USD. The hurdle is stipulated, not an observed current country premium or market valuation.

Measure	Value
Initial outlay, million USD	10.000000
Probability-weighted expected PV, million USD	9.701391
Expected-cash NPV at stipulated hurdle	-0.298609
Delay-probability break-even, if branch PV differs	6.3191%
Expected PV after diagnostic duplicate haircut	7.276043
Diagnostic duplicate expected PV reduction	2.425348
Difference in branch NPV, delay minus on-time	-1.598476

Baseline expected PV 9.701391 / NPV -0.298609 despite on-time positive NPV. Break-even delay probability is an algebraic threshold, not an estimate or approval; outside 0..1 means no feasible mixture reaches that threshold. No averaging INR then dividing by average FX, no one-year discount on the two-year branch. Diagnostic haircut does not establish every scenario plus premium double counts.

Audit | Separate bridges, separate currency checks

Authored identity flags test arithmetic references only. They do not verify tariff law, FX forecasts, risk premia, investment suitability, actual learner results or authority.

Importer identities valid? (1=yes)	1.000000
Guarded new total contribution, INR	936000.000000

Equity identities valid? (1=yes)	1.000000
Guarded expected-cash equity NPV, million USD	-0.298609

Importer annual INR and equity million USD are not additive. A structural pass does not permit ordering, supplier messages, customs declarations, hedge trades, subscriptions, transfers or disclosures. Missing source evidence or user authority stops real action.

Evidence | Definitions and risk location

Original D113/D114 exercises at https://top1os.dev/. Existing selected OpenStax/Damodaran teaching remains in course; no new empirical source reading or current FX/tariff/ERP claim.

Importer evidence registry	Input lineage: Importer inputs -> Importer / Cost attribution -> Audit. Real documents need invoice/payment currency, tariff classification/base/rate/effective date, tax recovery, distribution, inventory and actual customer response. None supplied. A required price at fixed volume is not a volume forecast.
Equity timing and units	Equity inputs -> Equity branches -> Equity summary -> Audit. Million INR becomes million USD at the branch date, then uses its own compound horizon. Matched INR rate follows the stipulated deterministic path; no market-forward, covered parity or risk-free claim.
Risk location, not a blanket rule	Probabilities model expected delay timing; terminal amounts model expected proceeds; stipulated hurdle may price systematic exposure. A certainty-equivalent adjustment is a separate convention, not automatic probability weighting. Diagnose exactly which loss is counted twice before removing a premium.
Strongest authored objections	Customer quantity may fall at a price threshold. Actual tariff base may differ. FX path may be stochastic, requiring coherent pricing assumptions rather than these identities. Branch probabilities/hurdle can be wrong; positive on-time value does not rescue negative weighted NPV. Missing liquidity/legal/capital calls remain unknown.
Fictional day0/day30 gate	Sourcing/demand/cash roles reconcile importer evidence; legal/FX/valuation roles check equity permits/timing/risk. No real person accepted these roles. Stop shipments, supplier contact, trades, subscriptions, transfers, borrowing, disclosure or spend without actual evidence and authority.
Delayed changed-context task	Without notes change supplier USD, synthetic tariff and customer volume; rebuild both attribution orders. Separately change delay probability/date and FX growth, rebuilding dated PV and matched rate. Record actual error/objection/correction and retest only if genuinely performed; do not invent measured mastery.

Actual work | No performed learner results

Actual attempt, confidence, source, error, correction, reviewer objection and delayed changed-context response remain blank.

Actual date / case	Attempt / confidence	Input / source	Observed error / reason	Correction / effect	Objection / reply	Delayed context / result

Actual work remains blank. Record only what occurred: dates, reasoning, error/source/correction, strongest objection and a new delayed transfer. No invented learner results, sponsor acceptance, actual budget release or signed rights.

Failure log | Authored execution only

Observed native tests are added only after execution. Not actual learner mistakes, independent human audit, Excel/Sheets parity, real authority or overall 10/10.

Controlled test	Observed authored outcome
Baseline unit / quote / branch PV	PASS: baseline quote, costs, contributions, dated branch PV and local/USD identity.
Importer price / quantity / tariff / FX	PASS: changed supplier price, quote, tariff, selling price and volume; restored.
Zero cost change / volume / contribution	PASS: zero cost-change/volume/old contribution make affected ratios undefined.
Attribution order / interaction checks	PASS: both attribution orders reconcile same total; interaction not added twice.
Delay probability / dates / FX growth	PASS: delay probability0/1, dates, flat and appreciating FX path recomputed.
Rates / payoff / duplicate diagnostic	PASS: changed hurdle, zero payoff, same dates and duplicate diagnostic0/1.
Invalid inputs / independent cases	PASS: 15 invalid-input cases block affected model, other case preserved.
Broken result references / isolation	PASS: four broken result references block affected summaries; case isolation.
Restored baseline / actual fields blank	PASS: baseline restored; saved caches error-free; actual learner fields blank.

Only the original synthetic course exercise at https://top1os.dev/ supplies the case figures. No new empirical reading, real participants, company records, Indian legal clearance, actual commitments or source completeness claimed.
