D77 | Recompute before you recognize

PRIVATE SYNTHETIC review. Independent operating and PV-decision cases; do not merge their units/horizons. Original exercise/rubric retained. No actual business decision, access or commitment.

Attempt first	Work without notes, show formulas and units, then compare. Log your own attempted answer, error cause and changed-context test. App day score/timestamp is not question-level weak-skill evidence.
12-week operating case	Recognized revenue 10, variable 6, avoidable fixed 1, collections 7 and capex 2, lakh INR. Stated operating costs paid, no other payables/tax/financing. Remainder 3, receivables 3 and endpoint cash -2; peak draw and quality UNKNOWN.
Independent PV decision	Common decision-date present-value NET endpoints over 12 months: build 14/-6, partner 7/2, defer 0. Favorable p=.5 gives 4/4.5/0, so partner under the stated risk-neutral monetary objective. No distribution is inferred from interviews.
Transfer and bound	At p=.7 build 8 beats partner 5.5. Crossover 8/15. Perfect costless instant state information at p=.5 gives 8, gross EVPI 3.5, not a guaranteed pilot benefit. Signal cost, delay, accuracy and cash feasibility are missing.
Evidence and remediation	Interview interest is not paid/repeat contribution. Preserve invite/completion denominators and nonresponses. Choose two remediation areas from actual errors; without error evidence, label choices provisional, not diagnosed.
No mastery certificate	Self-check, formula execution and familiar answer recognition do not prove independent transfer. Actual attempts/confidence/reviewer/delayed results remain blank. No learner or account flow was executed.

Inputs | Two independent cases

Yellow cells editable; all synthetic. Project monetary units lakh INR over 12 weeks; decision endpoints are already net present values over 12 months.

Project recognized revenue	10.00
Project variable costs	6.00
Project avoidable fixed	1.00
Project collections	7.00
Project capex	2.00
Proposed project operating target	2.50
Favorable probability	0.50
Build favorable net PV	14.00
Build unfavorable net PV	-6.00
Partner favorable net PV	7.00
Partner unfavorable net PV	2.00
Defer net PV	0.00

Project inputs structurally valid?	1.00
Decision inputs structurally valid?	1.00

Structural validity is not forecast accuracy or authority. Probability may be 0 or 1; negative net PV endpoints are allowed. Collections greater than recognized revenue violate this simplified zero-opening-receivables case. Model a different case explicitly rather than hide it.

Project | Positive operating is not cash

Independent 12-week horizon, lakh INR. Only the stated costs/collections/capex. No other payables, tax or financing; no dated events or delivery records.

Operating remainder	3.00
End receivables	3.00
Endpoint cash, direct	-2.00
Endpoint cash, operating bridge	-2.00
Bridge residual, expected zero	0.00

Operating target met? (1=yes)	1.00

Peak incremental cash draw	UNKNOWN
On-time delivery quality	UNKNOWN
Actual permission / approval	UNKNOWN

Case-v1 remainder 3 meets target 2.5, receivables 3, endpoint cash -2. This is not an unconditional pilot pass. Endpoint deficit does not establish the full peak draw; missing dated cash/delivery evidence stays UNKNOWN, not zero. Static prose must be revised after input edits.

Decision | Common PV, risk-neutral comparison

Independent decision case. Inputs already net of costs on a common decision-date PV basis. No further discounting or operating-case cash is added.

Build expected net PV	4.00
Partner expected net PV	4.50
Defer net PV	0.00
Best without information	4.50
Perfect-information expected net PV	8.00
Gross EVPI upper bound	3.50
Build/partner crossover p	53.33%

Crossover is algebra, not automatically a feasible probability or global optimum: check 0..1, tie and defer. Case-v1 p=.5: build 4, partner 4.5, perfect info 8, EVPI 3.5. At p=.7:8/5.5/perfect 10.4/EVPI 2.4. No actual signal experiment or forecast probability established.

A real pilot is neither perfect nor costless nor instant. Value its actual signal, cost, delay, financing constraints and feasible actions before comparison. EVPI is only a bound under these assumptions, not a promised return, permission or expected benefit of research.

Transfer | Keep claims and evidence apart

Authored prompts, not actual learner errors or independently validated skills.

Collections change only	Reduce collections 7 to 6 holding recognition/costs/capex fixed. Remainder stays 3, receivables 4, endpoint cash -3. Explain why target pass does not repair cash. Do not transfer this 12-week result into the independent 12-month PV decision.
Cost contradiction	Increase variable 6 to 7 with collections 7: remainder 2, receivables 3, cash -3; operating target 2.5 now fails. Preserve original inputs and the reason for accepting the contradiction.
Probability transfer	At p=.7 build 8, partner 5.5; choose build only under the stated unconstrained risk-neutral objective. At crossover 8/15 both yield 14/3. Defer may dominate different endpoints; no action is universally best.
Information limitation	State which action is chosen in each state and why perfect information value cannot be negative when the same feasible actions remain available. With p 0 or 1 EVPI is 0. Real tests need signal calibration, cost and timing.
Interview evidence	Higher B interview-interest fraction does not establish better paid demand, repeat use or contribution. Need invitations/completions/nonresponses/buying authority and cost-to-serve; no actual denominators are supplied here.
Delayed prompts	Later, solve with collections 6 and separately with p=.7 before looking at reference. Record actual answer and cause only if performed. Pick two remediation areas from your observed errors; no actual errors means provisional selection.

Evidence and gates | Source does not grant authority

Only original synthetic D77 curriculum at https://top1os.dev/ supplies these cases. No new empirical source, actual learner evidence or real permission.

Provenance	Project numbers are synthetic lakh INR/12 weeks; decision numbers are independent 12-month common PV net endpoints. Retain source, date, unit, horizon, assumption and unknowns per claim.
Day 0 | Evidence role	Check actual rights before any real records, participants, recording, sharing or spending. Synthetic drafting is permitted classroom work; fictional sponsor approval cannot replace actual permission.
Day 30 | Review role	Check fresh attempt and original reasoning if actually performed. Recompute bridges and compare decisions; distinguish formula error, denominator confusion and unsupported evidence. No app-derived question-level skill diagnosis.
Day 60 | Transfer role	Use delayed changed-context problems rather than recognition. Separate confidence, correctness and evidence quality. Keep missing responses blank and choose remediation areas only from real observed errors.
Day 90 | Decision role	Review change log, strongest objection and outstanding rights/cash/quality evidence. Proposed review point, not exact 12-week end or actual meeting. No business commitment or automatic release.
Strongest authored objection	Getting the reference numbers right may hide recognition and missing cash/quality assumptions. Response: require a fresh explanation and delayed transfer while leaving actual results and mastery claims unresolved.

Actual work | Actual mistakes only

No learner work, independent reviewer or delayed transfer has occurred in this artifact.

Date/context	Attempt	Confidence	Error/source	Correction	Remediation/provisional	Delayed result

Actual work remains blank. Record only what occurred: dates, reasoning, error/source/correction, strongest objection and a new delayed transfer. No invented learner results, sponsor acceptance, actual budget release or signed rights.

Failure log | Authored execution only

Observed native tests are added only after execution. Not actual learner mistakes, independent human audit, Excel/Sheets parity, real authority or overall 10/10.

Controlled test	Observed authored outcome
Baseline operating / decision	PASS: independent project bridge and PV/EVPI/crossover arithmetic.
Collections 6 transfer / restore	PASS: collections6 changes AR/cash, not operating; restored.
Variable 7 transfer / restore	PASS: variable7 changes operating/cash and target; restored.
Probability .7 / crossover / endpoints	PASS: p=0.7, 8/15, 0 and 1 checked; restored.
Invalid project / probability / PV	PASS: six invalid inputs block affected outputs.
Broken reference / restore	PASS: broken build reference blocks best decision; restored.
Actual attempts remain blank	PASS: actual attempts/confidence/delayed records remain blank.

Only the original synthetic course exercise at https://top1os.dev/ supplies the case figures. No new empirical reading, real participants, company records, Indian legal clearance, actual commitments or source completeness claimed.
