D 131 | A trajectory is not a verdict

PRIVATE FICTIONAL evidence lab. Original exercise/quiz retained. No real company classification, investment, restructuring, hiring, acquisition, customer contact or spend.

Case A performance	Mainstream need 70, low-end need 30, incumbent 80. Entrant 40,65,75: meets low-end at entry, first meets fixed mainstream need at observation 3. These are ordered observations, not equally spaced years or a forecast of displacement.
Priority versus viability	Entrant gross margin 20% versus incumbent approval hurdle 35% is a 15 percentage-point priority shortfall, not a 15% relative gap or proof of entrant profit. Added monthly toy revenue 1000, COGS 800, operating fixed 300 gives gross profit 200, operating result-100.
Case B denominator	80 prior nonconsumers among 100 first customers is 80% of that cohort. It is not market share, retention, incremental demand or disruption probability. Source of prior access, selection, business model and later trajectory need evidence.
Case C counterexample	A cheaper digital product that initially wins demanding incumbent customers through superior performance is sustaining competition under the stated foothold test. Cheap, digital, popular and successful do not settle the path.
RPV fit	Resources are assets; processes are ways of working; values are priority criteria, not simply ethics. Process mismatch may need a heavyweight team. Values mismatch may need allocation autonomy, not merely a different office. Diagnose resources separately.
Evidence and outcomes	Refreshed written theory,2001 RPV and 2015/2016 disagreement plus independent criticism. No diagram/video completeness, current company financial evidence, real test, independent learner, cross-viewer/account/legal or overall 10 claim. Actual work blank.

Inputs | Separate cases, shared units

Yellow controls fictional. Performance is a comparable index, not money. Monthly revenue/COGS/fixed costs separate from organizational priority hurdle. Binary fit controls are paper assumptions.

Mainstream performance need	70.00
Low-end performance need	30.00
Incumbent performance	80.00
Entrant observation 1	40.00
Entrant observation 2	65.00
Entrant observation 3	75.00

Prior nonconsumers, first cohort	80.00
Total first-customer cohort	100.00

Monthly toy revenue, INR	1000.00
Monthly toy COGS, INR	800.00
Monthly toy operating fixed costs, INR	300.00
Incumbent gross-margin approval hurdle, fraction	0.35

Existing processes fit? 1 yes,0 no	0.00
Existing priorities fit? 1 yes,0 no	0.00

Performance inputs valid?	1.000000
Cohort denominator valid?	1.000000
Economic inputs valid?	1.000000
Fit controls valid?	1.000000

COGS may exceed revenue: negative margin is a valid downside, not an input error. Monotonic improvement is not assumed after edits. No zero-denominator ratio is imputed. Static prose is baseline and must be revised for changed scenarios.

Trajectory | Thresholds are not adoption

Three ordered observations, fixed needs for the original case. No time intervals, market demand, customer movement, technology forecast or causal inference supplied.

Incumbent minus mainstream need, index	10.000000
Entry minus low-end need, index	10.000000
Entry minus mainstream need, index	-30.000000
Observation 2 minus mainstream need, index	-5.000000
Observation 3 minus mainstream need, index	5.000000

First observed mainstream threshold:0=none	3.000000
Observed improvement 1 to 3, index	35.000000

Baseline incumbent gap 10, low-end entry gap 10; entrant mainstream gaps-30/-5/+5; first meets at 3, observed improvement 35. Equality meets the stipulated threshold. Zero flag means none of these observations meets need, not never in the future. Crossing alone proves neither adoption nor displacement; moving needs could change the result.

Cohort | Eighty of which hundred?

First-customer cohort only. Counts are paper assumptions, not a survey sample or a population estimate. Prior nonconsumer status requires a defined access/use baseline.

Prior nonconsumer share, fraction	0.800000
Other first customers, count	20.000000
Other first-customer share, fraction	0.200000

80/100=.8 and 20/100=.2. Reducing denominator without changing numerator can make the case impossible. No total market denominator, repeat observation, counterfactual demand or probability model supplied: market share, retention, incremental demand and disruption probability remain unknown.

Economics | Gross margin is not profit

Added independent monthly toy. Original 20% entrant margin and 35% incumbent hurdle illustrated by revenue 1000/COGS 800. No tax, financing, capex, working capital or cash-flow model.

Monthly gross profit, INR	200.000000
Gross-margin fraction	0.200000
Gross margin minus hurdle, percentage points	-15.000000
Operating result after stated fixed cost, INR	-100.000000
Gross-margin hurdle met? 1=yes	0.000000

Revenue for operating break-even, fixed GM	1500.000000

Gross profit 200, margin.20, hurdle shortfall-15 percentage points, operating result-100; fixed 20% gross margin requires revenue 1500 to cover fixed 300. This threshold assumes COGS scales at the same fraction and fixed cost unchanged. It differs from revenue 1100 if COGS stayed fixed 800. Nonpositive GM has no positive-margin threshold here. Neither hurdle failure nor profit alone classifies disruption.

Fit | Resources are a separate question

Binary assumptions only. Recommendation codes are paper structure prompts, not organizational actions or a validated automated strategy. Missing resources cannot be repaired by the code.

Process mismatch flag	1.000000
Priority mismatch flag	1.000000
Structure code:1 existing,2 heavy,3 autonomous	3.000000

Baseline both mismatched -> code 3: investigate autonomous allocation and new processes. Process mismatch with priority fit -> code 2, heavyweight team inside core. Both fit -> code 1, existing/lightweight arrangements may fit. Priority mismatch even with process fit -> autonomy question remains; do not invent a source quadrant label. Separate location is not allocation independence; no actual restructuring, acquisition or personnel action.

Evidence test | Do not total a disruption score

Six qualitative tests guide evidence collection, not six interchangeable votes. Meeting numeric thresholds is not an automatic classification.

Foothold and baseline	Who was overserved or excluded at entry, relative to which incumbent, product, geography and date? CaseA low-end need 30 versus entrant 40 is compatible with service, not evidence those buyers actually existed or chose it.
Inferior on old metric	Entry 40 below mainstream 70; compare the performance customers paid for, not a convenient new metric selected after success. CaseC initially superior for demanding incumbent customers is a counterexample to the stated foothold account.
Accessibility and enabler	Record affordability/convenience/access and the specific technical/business-model improvement path. Cheap alone may be subsidized marketing; digital alone is not a business model or permission to bypass rules.
Viable model and priorities	Gross margin 20% does not establish positive operating result. Priority hurdle 35% helps explain allocation conflict, not proof executives ignored a specific entrant. Need dated costs, full model and resource-allocation evidence.
Trajectory and incumbent response	Crossing need at observation 3 does not prove adoption, profitable scale, displacement or inevitable incumbent failure. Need repeated cohort/financial evidence and competing explanations, including regulation and capability constraints.
Falsifier and decision	Dated entry evidence of demanding mainstream buyers weakens A low-end claim. Unsupported UPI/Jio/PhysicsWallah and Uber classifications remain open. Write claim, foothold, trajectory, alternative and refuting metric; no real market action.

Sources | Theory, interpretation and criticism

Refreshed 13 November 2026. Written coverage only; distinct authorship/authority and historical dates. No source images, diagrams or audiovisual mastery claimed.

Institute theory	https://www.christenseninstitute.org/theory/disruptive-innovation/ - returned written definition, six tests, taxonomy and case narratives. Originator institution; simplified current page, not independent causal proof. Historical valuation/case numbers not imported.
RPV 2001 archive	https://personal.utdallas.edu/~chasteen/Christensen%20-%202nd%20article.htm - full returned written Summer2001 article read. Resources/processes/priority criteria; process-fit versus values-fit structure. Third-party archive, historical company examples not current evidence. Chart itself not inspected.
HBR 2015 route	https://hbr.org/2015/12/what-is-disruptive-innovation - summary only. HBS-hosted PDF extracted written text selected: low-end/new-market/process/success distinction, taxi versus black-car scope, limits. Not full PDF pixels/figures or every page; source reprint permission limits respected, no copied source asset.
Horn16June2016	https://www.christenseninstitute.org/blog/uber-disruptive-innovation-and-regulated-markets/ - full returned written interpretation read. Disagrees on Uber/taxi boundary; acknowledges unavailable financials and disputed early response. Its pure-profit/sustainability/regulation predictions are not adopted as current facts.
Independent critique	https://tuck.dartmouth.edu/news/articles/deflating-disruption-theory - university report of King/Baatartogtokh2015 expert-case criticism, not independent replication of their data. https://sloanreview.mit.edu/article/how-useful-is-the-theory-of-disruptive-innovation/ - selected returned introduction/survey-method footnote sections only, not full linked data/appendices.
Coverage boundary	Originator theory, scholarly reprint/archive, independent critique and interpretive commentary are not six independent replications. Case labels can differ with boundaries. No guarantee of prediction, actual company verdict, learner transfer, native cross-viewer/account/legal or overall 10 completion.

Actual work | No invented classification or mastery

Only performed permission-cleared work. Keep private company/customer data out. Record new reasoning, strongest objection, correction and delayed transfer.

Date/version	Case boundary	Foothold evidence	Arithmetic correction	RPV/alternative	Reviewer finding	Delayed transfer

Actual work remains blank. Record only what occurred: dates, reasoning, error/source/correction, strongest objection and a new delayed transfer. No invented learner results, sponsor acceptance, actual budget release or signed rights.

Failure log | Authored execution only

Observed native tests are added only after execution. Not actual learner mistakes, independent human audit, Excel/Sheets parity, real authority or overall 10/10.

Controlled test	Observed authored outcome
Independent baseline arithmetic	PASS:23 baseline formulas independently recomputed.
Changed trajectory/threshold sets	PASS:8 changed trajectory sets including equality/no crossing.
Changed cohort denominators	PASS:4 changed cohort denominator/numerator sets.
Changed economics and RPV fit	PASS:8 economic and4 process/values fit sets.
Invalid controls and isolation	PASS:16 invalid controls and unaffected model isolation.
Broken-reference explicit holds	PASS:6 broken references produce explicit calculation errors.
Restored baseline/clean caches	PASS:24 changed sets+restored baseline; clean saved caches.
Actual/reviewer/transfer blank	PASS:actual learner/reviewer/delayed transfer remain blank.

Only the original synthetic course exercise at https://top1os.dev/ supplies the case figures. No new empirical reading, real participants, company records, Indian legal clearance, actual commitments or source completeness claimed.
