D 136 | Decisions need boundaries and outcomes

Private fictional service-operation design. No actual Air India org chart, KPI, employee change, system access, roster, route, fare, vendor, budget or safety authorization.

Roles are not steps	RAPID names Recommend, Agree, Perform, Input and Decide, not a lockstep sequence. One recommender; ideally one decider. A group decider needs an explicit disagreement rule. Agree is limited to specified mandatory constraints, not every opinion.
A role is not permission	Bain says unresolved R/A views go to D. That does not make D a legal or safety override. Required approval must be obtained or the proposal changed/stopped. Toy Gate requires all listed approvals, role clarity and implementation checks; a green result is not actual permission.
Attendance is not ability	Of 100 eligible people, 90 attend and 60 independently demonstrate the task: 90% attendance and 60% demonstrated ability. No linked roster supplied, so 60/90 is not automatically an attendee conversion rate. Knowledge, desire and sustained use are not inferred.
Faster can mean worse	Before 100 calls at 10 min with 80 first-contact resolved; after 120 at 8 min with 84 resolved. Total 1000 to 960 min (-4%); resolution 80% to 70% (-10 percentage points, -12.5% relative). Resolved count rises 5% while rate falls.
Separate follow-up scenario	Unresolved counts 20 and 36 do not establish repeats. Only under an explicit one-extra-contact at 6 min per unresolved case assumption: additional 120/216 min, total 1120/1176 (+5%). No causal effect, actual workload or customer outcome proven.
Change support	Kotter urgency can concern an opportunity; current page explains evolution to accelerators. ADKAR is an individual model within a broader methodology; sequential but not linear, reassess earliest unmet needs. Vendor claims are not independent efficacy evidence.

Inputs | Separate cohorts and toy checks

Yellow synthetic controls. Counts whole and nonnegative; eligible/call denominators positive; minutes nonnegative. No implied link between attendance and independent demonstrations.

Eligible people	100.00
People attending training	90.00
People independently demonstrating task	60.00

Before calls	100.00
Before mean handling minutes	10.00
Before first-contact resolved calls	80.00

After calls	120.00
After mean handling minutes	8.00
After first-contact resolved calls	84.00

Separate extra minutes per unresolved case	6.00

Inputs | Separate cohorts and toy checks

Yellow synthetic controls. Counts whole and nonnegative; eligible/call denominators positive; minutes nonnegative. No implied link between attendance and independent demonstrations.

Toy: mandatory signoffs complete? 0 no / 1 yes	1.00
Toy: owner authorized this specific scope? 0/1	1.00
Toy: recommender count (must equal1)	1.00
Toy decider mode:1 single,2 group	2.00
Toy: group disagreement rule clear? 0/1	1.00
Toy: performer and deadline clear? 0/1	1.00
Toy: execution evidence check defined? 0/1	1.00

Adoption controls valid?	1.000000
Before controls valid?	1.000000
After controls valid?	1.000000
Follow-up assumption valid?	1.000000
Toy design controls valid?	1.000000

Toy approvals are stipulated scenario switches, not records of real approval. Zero mean minutes is allowed as a limiting numeric case; relative change with zero baseline is undefined, never silently zero. Input validation cannot establish data quality, case mix, law or authority.

Adoption | Attendance and demonstrated ability

Fractions: 0.90=90%. Different observations; both denominators are all eligible people. No unobserved skill or roster relationship invented.

Attendance share of eligible	0.900000
Independent demonstration share of eligible	0.600000
Eligible not recorded attending	10.000000
Eligible without independent demonstration	40.000000
Attendance less demonstration: percentage points	30.000000

Baseline 90%, 60%, 10, 40 and 30 percentage points. Counts are separate marginal observations, not proof the 60 are among the 90. Do not infer attendee conversion, desire, knowledge, sustained use or organizational adoption from attendance.

Calls | Counts, rates and total minutes

Comparable fictional case mix/period/definitions assumed for arithmetic, not verified. A rate change in percentage points differs from a relative percent change.

Before total handling minutes	1000.000000
After total handling minutes	960.000000
Total-minute change: fraction of baseline	-0.040000
Before first-contact resolution share	0.800000
After first-contact resolution share	0.700000
Resolution change: percentage points	-10.000000
Resolution change: fraction of baseline rate	-0.125000
Call-volume change: fraction of baseline	0.200000
Mean-duration change: fraction of baseline	-0.200000
Resolved-count change: fraction of baseline	0.050000

Baseline 1000/960 minutes, -4%; resolution 80%/70%, -10 percentage points, -12.5% relative; volume+20%, mean duration-20%, resolved count+5%. These two observations do not prove causality, statistically reliable improvement, service quality or equal case mix. No automatic incentive reward.

Follow-up | An assumption, not observed repeats

Separate scenario only: each unresolved case generates exactly one extra 6 minute contact. Unresolved does not logically imply a repeat, one repeat, or 6 minutes.

Before unresolved at first contact	20.000000
After unresolved at first contact	36.000000
Before assumed extra minutes	120.000000
After assumed extra minutes	216.000000
Before modeled combined minutes	1120.000000
After modeled combined minutes	1176.000000
Combined-minute change: fraction of baseline	0.050000

Baseline 20/36 unresolved, assumed 120/216 extra minutes, modeled 1120/1176 total, +5%. This does not reconcile a real queue or establish actual repeat contacts, cost, capacity or customer benefit. Obtain matched-case follow-up, quality and accessibility evidence before a real decision.

Gate | Toy readiness is not actual authority

Numeric flags: 1 pass, 0 stop. Any missing mandatory approval stops this toy even if the decider wants to proceed. Validating a flag is not verifying its truth.

Mandatory signoffs ready?	1.000000
Specific owner scope approved?	1.000000
Exactly one recommender?	1.000000
Decider structure explicit?	1.000000
Performer and deadline ready?	1.000000
Execution check ready?	1.000000
ALL listed toy conditions pass?	1.000000

A green gate means these listed fictional switches passed, not a complete risk assessment, lawful permission or actual implementation. Bain escalation resolves views within real constraints; it does not let a role waive law, safety, budget or required consent. Single decider does not need a group rule.

Design | Five bounded recurring decisions

Fictional practice prompts only. Actual named people, authority, evidence and final decisions are deliberately not supplied.

1 | Exception triage	Define exception scope and exclusions. Design one R, mandatory A constraints, I affected users, D or explicit group rule, P, deadline, escalation and evidence check. Stop at safety or scope uncertainty.
2 | Knowledge revision	Choose how a fictional answer guide is reviewed. Separate content recommendation from mandatory compliance checks and actual publishing authority. Include rollback/version evidence.
3 | Training support	Choose support after independent task observation, not attendance alone. Diagnose awareness/desire/knowledge/ability/reinforcement without guessing an individual barrier. Seek consent for real observations.
4 | Quality sampling	Design sampling period, eligible cases, case-mix strata, definition of first-contact resolution and quality/accessibility safeguards. Specify who checks the sample and how discrepancies escalate.
5 | Incentive review	Compare speed, first-contact resolution, repeat contacts and safety/quality before considering incentives. Owner authorization and lawful employee process remain separate from a training pilot. No actual reward or employee action.
Measure the tradeoff	IHI distinguishes outcome, process and balancing measures and recommends time-series and affected-person input. Its healthcare examples are not airline validation; a two-period toy cannot establish sustained improvement.

Actual work | Attempt before reference

PRIVATE BLANK learner/reviewer evidence. Five decision rows. Record scope, R/A/I/D/P, rule/deadline, source/mandatory signoff, execution evidence and stop condition. No real people or systems required.

Scope	R / A / I	D / rule	P / deadline	Source / signoff	Execution check	Stop / reviewer

Transfer: change one numeric family and one decision constraint, justify the new result, then restore. Reviewer: check scope and denominators independently. Date/evidence/outcome remain unrecorded until actual work exists. Do not enter sensitive employee or customer data.

Evidence | Written coverage and limits

Six sources, not six independent efficacy tests. Refreshed 13 November 2026. No embedded videos, diagrams, current airline organization or individual evidence verified.

Bain 2023 /2007	https://www.bain.com/insights/rapid-decision-making/ and https://www.bain.com/insights/making-good-decisions-and-making-them-happen/ | Complete returned written text, not diagram.2023 permits a group D with clear rule; 2007 single-person wording is not universal. Same firm, not independent replication. Historical survey not current causal evidence.
Kotter	https://www.kotterinc.com/methodology/8-steps/ | Complete returned written page, not embedded video. Linear steps evolved to accelerators; opportunity urgency allowed. Vendor success claims not independently tested.
Prosci	https://www.prosci.com/methodology/adkar | Complete returned written page/FAQs, not image. Individual model, not whole methodology; sequential but not linear, earliest unmet need and reassessment. No inferred employee barrier.
Air India 12 Nov 2024	https://www.airindia.com/in/en/newsroom/press-release/vistara-merger-completed-second-airline.html | Complete returned historical company release. Merger/program facts dated 2024; future maintenance plans not verified realized. No current fleet, KPI, organization or decision rights supplied.
IHI measurement	https://www.ihi.org/library/model-for-improvement/establishing-measures | Complete returned written page. Outcome/process/balancing measures, time series, qualitative/quantitative and affected-person input. Healthcare guidance transferred as a design aid, not airline causal proof.
What remains open	Authored toy recalculation and visual checks do not establish native Excel/Sheets parity, full audiovisual review, independent learner transfer, production account flow, legal applicability or overall 10. Original exercise/quiz retained. No new account, spend or testing permission.

Failure log | Recompute and challenge

Authored LibreOffice checks only. Changed/invalid controls and error references tested, then baseline restored. Not actual learner or production evidence.

1	PASS:34 baseline formulas independently recomputed.
2	PASS:24 changed sets and clean restore.
3	PASS:16 invalid controls/544 isolation checks.
4	PASS:6 broken references/6 error checks.
5	PASS:ability above attendance allowed,not linked cohort.
6	PASS:zero baseline relative changes undefined.
7	PASS:missing signoff/owner/group rule stop toy gate.
8	PASS:actual learner/reviewer rows blank.
