D112 | Fresh mixed retrieval

PRIVATE FICTIONAL cases. Auction crore, economy indexes and separate lender crore must stay separate. No learner has performed this task; no real bid, loan or policy decision.

Attempt before the reference	Write your own probability tree, exact GDP/population ratio and time-weighted lender calculation on Actual work before opening the result sheets. Do not copy worked answers as an attempt. Record confidence before feedback only if actually stated.
Auction reference | Policy-specific	Prior low/high 0.5 each; common values 60/140, supplied win chances 0.6/0.2. P(win)=0.4, posterior high=0.25, conditional common=80. Net private benefit 8 gives value 88 versus bid 90: conditional surplus -2, unconditional -0.8. Downside benefit 4 gives -6 / -2.4.
Macro reference | Exact denominators	Nominal 100 -> 118, matched deflator 100 -> 110, population 100 -> 101. Exact real growth 7.272727%, real per capita growth 6.210621%. Subtraction 7% overstates the latter. Output per person is not each household or store demand.
Lender reference | Quarter versus half year	Assets 500 at 12%, funding 400 at 8%; baseline NII 28/NIM 5.6%. Funding 200 resets +200 bp immediately; loans 300 reset +100 bp only for last quarter. First-year NII 24.75/NIM 4.95%; corrected loan timing to last half-year gives 25.5/5.1%.
What counts as evidence	Native arithmetic checks are authored execution, not learner mastery. Pick provisional review from actual item-level errors only. A day aggregate or watch timestamp cannot recover errors. Actual attempts, reviewer objections and delayed retest remain blank.
Stop boundary	Static reference prose is Case-v1 and must be revised after input edits. No real auction, deposit, lending, derivative, vendor message, disclosure or spend. No full audiovisual/source/Excel/Sheets/learner/account clearance or overall 10/10.

Auction inputs | Two states, one supplied policy

Crore. Conditional win probabilities describe this one bid policy only; changing its bid without new win evidence is a sensitivity, not an optimal strategy.

Low common value	60.00
High common value	140.00
Prior probability low	0.50
Prior probability high	0.50
Probability win conditional on low	0.60
Probability win conditional on high	0.20
Base net private benefit after integration cost	8.00
Supplied-policy bid paid only if winning	90.00
Separate downside net private benefit	4.00

Structural inputs valid? (1=yes)	1.000000

Yellow cells are fictional assumptions, not observed data or permission. A structural pass does not establish current source definitions, demand, contractual terms, economic feasibility, liquidity or real authority.

Auction reference | Selection changes value

No-loss-on-losing convention; no bid fee/deposit/capital lockup. Losing gives zero. Conditional values are undefined if P(win)=0; direct unconditional surplus can still be zero.

Measure	Base private benefit	Downside benefit
Joint probability low AND win	30.0000%	30.0000%
Joint probability high AND win	10.0000%	10.0000%
Probability of winning	40.0000%	40.0000%
Posterior probability high given win	25.0000%	25.0000%
Conditional common value given win	80.000000	80.000000
Net private benefit	8.000000	4.000000
Conditional net value given win	88.000000	84.000000
Supplied-policy bid	90.000000	90.000000
Conditional surplus given win	-2.000000	-6.000000
Unconditional expected surplus, direct joint	-0.800000	-2.400000
Unconditional common value, NOT winner value	100.000000	100.000000
Naive unconditional common plus private	108.000000	104.000000

At the supplied policy, do not use unconditional common 100 + net private 8 to justify bid 90. No win-probability curve or equilibrium is supplied, so no optimal bid or safe interval is established. No real coordination, bid or deposit authorized.

Macro inputs | Fresh matched series

Two fictional periods. Nominal currency indexes, GDP deflator SAME base 100 and matched population. No current country, PPP, exchange-rate or household estimate.

Old nominal GDP	100.00
New nominal GDP	118.00
Old matched GDP deflator	100.00
New matched GDP deflator	110.00
Old population	100.00
New population	101.00

Structural inputs valid? (1=yes)	1.000000

Yellow cells are fictional assumptions, not observed data or permission. A structural pass does not establish current source definitions, demand, contractual terms, economic feasibility, liquidity or real authority.

Macro reference | Multiply denominators

Exact per capita growth is (new nominal / old nominal) / (new deflator / old deflator) / (new population / old population) - 1.

Measure	Value
Old real GDP on base 100	100.000000
New real GDP on same base	107.272727
Nominal growth	18.0000%
Deflator growth	10.0000%
Population growth	1.0000%
Exact real GDP growth	7.2727%
Old real GDP per capita	1.000000
New real GDP per capita	1.062106
Exact real GDP per capita growth	6.2106%
Subtraction approximation, NOT exact	7.0000%
Approximation minus exact, percentage points	0.789379

Baseline 6.210621% is not subtraction 7%. Matched base changes affect real levels, not growth ratios. Actual evidence needs release/revision date, base, coverage and population definition. Average output is not disposable income or each store demand.

Lender inputs | Changed evidence is timing only

One year, crore, static balances, simple annual interest. Delays are fractions of a year before one reset. No growth, fees, compounding, repayment, tax, nonaccrual or balance-sheet valuation.

Average earning assets, crore	500.00
Old annual asset rate (fraction)	0.12
Funding balance, crore	400.00
Old annual funding rate (fraction)	0.08
Loans resetting, crore	300.00
Original asset reset delay, year fraction	0.75
Funding resetting, crore	200.00
Funding reset delay, year fraction	0.00
Asset rate increment, basis points	100.00
Funding rate increment, basis points	200.00
Annual operating expense, crore	8.00
Annual credit loss expense, crore	3.00
Corrected asset reset delay, year fraction	0.50

Structural inputs valid? (1=yes)	1.000000

Yellow cells are fictional assumptions, not observed data or permission. A structural pass does not establish current source definitions, demand, contractual terms, economic feasibility, liquidity or real authority.

Repricing | Correct only the contract timing

Original last-quarter active time is 0.25 year; corrected last-half active time is 0.5 year. Funding timing and all balances/rate changes stay identical.

Measure	Original contract	Corrected contract
Resetting asset balance	300.000000	300.000000
Asset rate increment	1.0000%	1.0000%
Asset delay before reset	0.750000	0.500000
Asset active fraction, first half	0.000000	0.000000
Asset active fraction, second half	0.250000	0.500000
Asset interest increment, first half	0.000000	0.000000
Asset interest increment, second half	0.750000	1.500000
Annual asset interest increment	0.750000	1.500000
Funding rate increment	2.0000%	2.0000%
Funding interest increment, first half	2.000000	2.000000
Funding interest increment, second half	2.000000	2.000000
Annual funding interest increment	4.000000	4.000000

Baseline first-year asset increment 300*0.01*0.25=0.75; corrected 1.5. Funding increment 200*0.02*1=4 in both. Half-year interest is an earned amount, not an annualized run rate. No actual contract evidence supplied.

Lender reference | Interest, then separate expenses

Annual sums use each half-year once. NIM denominator is average earning assets 500, not funding 400 or equity 100. Credit expense is outside NII and NIM.

Measure	Baseline	Original contract	Corrected contract
First-half interest income	30.000000	30.000000	30.000000
First-half funding expense	16.000000	18.000000	18.000000
First-half NII	14.000000	12.000000	12.000000
Second-half interest income	30.000000	30.750000	31.500000
Second-half funding expense	16.000000	18.000000	18.000000
Second-half NII	14.000000	12.750000	13.500000
Annual interest income	60.000000	60.750000	61.500000
Annual funding expense	32.000000	36.000000	36.000000
Annual NII	28.000000	24.750000	25.500000
NIM on average earning assets	5.6000%	4.9500%	5.1000%
NIM change vs baseline, bp	0.000000	-65.000000	-50.000000
Annual credit loss expense	3.000000	3.000000	3.000000
Annual operating expense	8.000000	8.000000	8.000000
Modeled pretax result	17.000000	13.750000	14.500000
Pretax change vs baseline	0.000000	-3.250000	-2.500000
Fully repriced equal-year NII, same balances	28.000000	27.000000	27.000000
Naive balance gap x FUNDING shock	0.000000	2.000000	2.000000

Baseline NII 28/NIM 5.6%/pretax 17. Original NII 24.75/NIM 4.95%/pretax 13.75. Corrected NII 25.5/NIM 5.1%/pretax 14.5. Naive +2 fails because asset/funding rate increments and time weights differ. Equal-year NII 27 is not first-year income or a forecast. No liquidity, EVE, regulatory ECL or cash charge-off measured.

Audit | Separate case checks and guarded summaries

Authored identities are not learner performance or source/permission evidence. Missing or broken results block only their case summary.

Auction conditional identity valid? (1=yes)	1.000000
Guarded base unconditional expected surplus	-0.800000
Macro identity valid? (1=yes)	1.000000
Guarded exact real per capita growth	6.2106%
Lender identity valid? (1=yes)	1.000000
Guarded corrected-contract pretax	14.500000

No summed investment/skill score. Identity flags do not validate the structural assumptions, optimal bids, real population definitions, actual reset terms, learner mastery, legal compliance or action authority.

Transfer | Actual errors, then new context

Original D112 written exercise at https://top1os.dev/. Existing selected Yale/OpenStax/FDIC/IES teaching remains in the course; no new source reading, actual reviewer or learner evidence claimed.

Item-level evidence, not aggregate inference	Actual work is intentionally blank. Record exact attempted question, response, confidence before feedback, observed error and corrected explanation. Preserve wrong answers as evidence. Do not reconstruct weak items from a day aggregate or watched percent.
Provisional remediation | Auction	If an actual response used the unconditional value, redraw prior x conditional-win branches, normalize by P(win), then distinguish conditional versus unconditional surplus. A bid change needs policy-specific win evidence, not reused certainty.
Provisional remediation | Macro	If an actual response subtracts growth rates, rebuild multiplicative deflator and population denominators with units. Test an alternate common index base, and explain why growth survives while real levels change.
Provisional remediation | Lender	If an actual response uses naive gap or full-year loan time, place asset/funding resets on a one-year timeline. Correct loan timing only, preserving funding and credit rows. Explain NII, NIM denominator, pretax and limits separately.
Day 7 changed-context task | Do not prefill results	Without notes use auction priors 0.4/0.6 and win chances 0.5/0.1, macro nominal 124 / deflator 115 / population 103 on old indexes 100, and loan original delay 0.6 versus corrected 0.25 with funding delay 0.25. State the new outputs and objections independently. These are proposed test inputs, not a performed retest.
Fictional owners and day 0/day 7 stop	Evidence role checks provenance, credit role checks reset/expense definitions, cash role checks excluded deposits/liquidity; no real person accepted a role. Choose two review areas only after observed new errors. Stop real bids, lending, disclosure and spend until separate evidence and actual authority exist.

Actual work | No learner attempt invented

Actual item-level response, confidence, observed error, correction, reviewer objection and delayed new-context response stay blank until genuinely performed.

Actual date / item	Attempt / confidence	Exact input / source	Observed error / reason	Correction / effect	Objection / reply	Delayed context / result

Actual work remains blank. Record only what occurred: dates, reasoning, error/source/correction, strongest objection and a new delayed transfer. No invented learner results, sponsor acceptance, actual budget release or signed rights.

Failure log | Authored execution only

Observed native tests are added only after execution. Not actual learner mistakes, independent human audit, Excel/Sheets parity, real authority or overall 10/10.

Controlled test	Observed authored outcome
Baseline auction / exact macro / lender	PASS: all baseline formulas independently recalculated; three cases not summed.
Changed priors / win evidence / downside	PASS: priors, policy-specific win evidence, downside and bid sensitivity; not optimum.
Changed macro denominators / base	PASS: common deflator-base change preserves growth; population and zero output checked.
Quarter / half / arbitrary timing	PASS: original/corrected arbitrary reset timing and independent funding delay.
Rate changes / expenses / zero resets	PASS: negative/zero rate changes, changed expenses and zero asset reset.
Invalid inputs / case isolation	PASS: 16 invalid-input cases block affected model; independent cases preserved.
Zero winning event / undefined conditional	PASS: zero winning event makes conditional values undefined; direct surplus zero.
Broken result references / isolation	PASS: three broken result references block affected audit; independent cases preserved.
Restored baseline / actual fields blank	PASS: baseline restored; saved formula caches error-free; actual learner fields blank.

Only the original synthetic course exercise at https://top1os.dev/ supplies the case figures. No new empirical reading, real participants, company records, Indian legal clearance, actual commitments or source completeness claimed.
