D128 | New demand is a hypothesis

PRIVATE FICTIONAL monthly learning-service proposal. All money rupees per learner-month or per month as labeled. No actual learners, research, price change, experiment, enrollment, purchase or spend.

Cost bridge	Old variable400 minus nonessential studio120 minus paid-acquisition50 plus practical-feedback40 plus clinics30 = new variable300. New price500 yields200 contribution versus old500-400=100. Do not remove accessibility, privacy, teaching support or required protections.
Cannibalization	Existing2000 paying learners remain baseline. Proposed500 includes100 diverted from own old service, not500plus100. New contribution100000 less lost old10000 less fixed60000 gives incremental30000. Post1900*100+500*200-60000=230000 versus200000 baseline.
Two break-evens	At fixed100 own diversions, continuous break-even350 new-service paid learners. At fixed20% diversion RATE, per-new contribution is180 and break-even333.333333, requiring334 whole learners for positive gain here. These are different assumptions. Equality is zero incremental gain.
Descriptive registry	Of500,100 own switchers/220 rival switchers/180 formerly free-only sum500. Only180/500=36% described as new to the DEFINED paid-course category. Rival switching is not new category demand. This classification is not causal conversion or retention proof.
Canvas and evidence	Keep raw rupees,hours,tasks and documented schedule windows separate; do not average them into utility. As-is observations and target proposals have distinct evidence statuses. Unverified values remain blank; no invented IndiGo/train-bus or FD-saver conversion history.
Scope	Selected originator written text, not full diagram/video/interactive coverage or independent efficacy evidence. Actual learner/reviewer/transfer remain blank. Native authored checks do not establish Excel/Sheets parity, account/legal permission or overall10/10.

Inputs | One month, two exclusive products

Synthetic rupees and paid learner counts. Old variable costs include no changes to protected teaching/accessibility/privacy obligations. Additional fixed cost is incremental, not already in variable costs.

Old variable cost, rupees per learner-month	400.00
Studio variable cost eliminated	120.00
Acquisition variable cost reduced	50.00
Added feedback variable cost	40.00
Added clinics variable cost	30.00
Old monthly price, rupees	500.00
New monthly price, rupees	500.00
Existing old-service paying learners	2000.00
Proposed new-service paid learners	500.00
Own old-service diversions INCLUDED in new count	100.00
Additional monthly fixed cash cost, rupees	60000.00
Alternative fixed diversion RATE	0.20

Unit-cost/price inputs valid? (1=yes)	1.000000
Fixed-diversion volume/fixed inputs valid?	1.000000
Rate scenario inputs valid? (1=yes)	1.000000

Subtractions are named components of old variable cost, so combined reductions cannot exceed it in this authored bridge. Negative contribution or incremental gain remains visible. More paid count is not automatically new-category demand. Alternative rate is separate from fixed100 diversions.

Unit bridge | Cost is not customer utility

Rupees per paid learner-month. Same defined service/cash-cost boundaries; no fixed-cost absorption counted as cash saving.

New variable cost	300.000000
Old unit contribution	100.000000
New unit contribution	200.000000
Unit contribution change	100.000000
Cost bridge identity difference	0.000000

Baseline new300,old contribution100/new200,change100. Input reductions are conditional assumptions, not measured savings. Higher contribution does not prove buyer utility, retention or a blue ocean. Price includes all assumed fees/refunds; real omissions require model revision.

Economics | Baseline versus proposal

Rupees per month. Proposed paid count already includes own diversions. Old-service demand lost is valued at OLD contribution, not gross price.

Baseline total old-service contribution	200000.000000
Remaining old-service learners	1900.000000
Proposed-service contribution before fixed	100000.000000
Lost old-service contribution	10000.000000
Incremental monthly result	30000.000000

Post-proposal total contribution less new fixed	230000.000000
Bridge difference: post minus baseline minus gain	0.000000

Baseline200000;post230000;incremental30000. This is a monthly contribution comparison with stated incremental fixed cash cost, not profit after unknown costs or an NPV. Own diversion reduces old count to1900. No actual enrollment or price change.

Fixed break-even | Freeze own diversions

Conditional on100 fixed own diversions in baseline and the stated additional fixed cost. No silently scaled diversion rate.

Rupees to cover: fixed plus lost old contribution	70000.000000
Continuous break-even new-service count	350.000000
Smallest whole count for nonnegative gain	350.000000
Incremental gain at feasible whole count	0.000000
Feasibility of positive-slope break-even	CONDITIONAL COUNT

Baseline continuous350 and whole350, gain0 at equality. Count cannot be below own diversions. Nonpositive new unit contribution makes this positive-slope formula undefined; it does not license a negative learner target or prove no alternative business design exists.

Rate break-even | A different assumption

Alternative fixed diversion rate, not simultaneous use of fixed100. Continuous expected diverted count may be fractional. Capacity still limited by existing own learners.

Incremental contribution per new learner under rate	180.000000
Continuous new-service count to cover fixed	333.333333
Whole new count for nonnegative expected gain	334.000000
Expected gain at whole count	120.000000
Expected diversions at whole count	66.800000
Capacity status, not permission	WITHIN EXPECTED CAPACITY

Baseline marginal180,continuous333.333333,whole334 gives120 expected incremental gain and66.8 expected diversions. Fractional expected diversions are not observed people or a rounding rule for actual enrollment. Capacity failure holds the proposal; no financial or research authorization.

Registry | Prior alternative is not causality

Synthetic classification of the proposed cohort. Category is paid job-skills courses. Counts are mutually exclusive by stipulation, not actual interview evidence.

Own old-service switchers	100.00
Rival paid-course switchers	220.00
Previously free-tutorial/peer-help only	180.00

Counts match proposed volume? (1=yes)	1.000000

Classified total, learners	500.000000
Share described as new to defined paid category	36.0000%
Share described as own diversion	20.0000%

Baseline180/500=36% new-to-category;100/500=20% own diversion. Prior alternatives do not establish that the proposal caused paid adoption, improved learning or sustained retention. Rival220 is switching, not newly created category demand. Zero cohort gives undefined shares, not zero conversion.

Canvas | Observe first, propose separately

No historical Indian airline or broker values reconstructed from reputation. Blank as-is/target cells intentionally record no measurements or approved targets. No raw-unit average or utility index.

Buyer factor	Unit / direction	As-is observed	Proposed target	Source/date/status	Buyer-perceived check	Required constraint
Monthly total price	INR;lower=cheaper			UNVERIFIED / proposal only	Not measured	Include fees/refunds
Feedback turnaround	Hours;lower=faster			UNVERIFIED / proposal only	Not measured	Define clock/cutoff
Tasks reviewed weekly	Count;higher=more			UNVERIFIED / proposal only	Not measured	Quality not count alone
Scheduling choice	Documented windows			UNVERIFIED / proposal only	Not measured	Accessibility/availability

If an illustrative1-5 index is later used, declare anchors, direction, transform, weighting and assumption status. A differentiated curve alone proves neither buyer utility nor incremental demand. Leave actual observations blank until evidence exists. Do not treat source example curves as current measured competitors.

ERRC | Four actions with dependencies

Fictional proposal, not implemented changes. No real teaching/support/service/price change, enrollment offer, experiment or subsidy is authorized.

Eliminate	Nonessential studio production for introductory videos. Stipulated variable saving120/learner-month. Preserve clear teaching, captions, accessibility and necessary materials; no actual vendor contract or saving verified.
Reduce	Paid-acquisition dependence. Stipulated variable saving50. Lower marketing spend may reduce new enrollments;500 paid demand is an assumption, not unchanged causal demand proof.
Raise	Timely practical feedback. Added variable40. Need defined turnaround clock and rubrics, trained capacity, quality and appeal checks. More feedback is not automatically better outcomes.
Create	Flexible task clinics. Added variable30. Need defined scheduling windows, permitted staff/resources, access and learner safety. A new feature is not proof that former noncustomers will pay.
Dependencies	Buyer outcome/finance/quality/permission are fictional day0/day7 role labels, not people who accepted jobs. Validate costs and allowed use;prespecify learning/retention/refund/accessibility outcomes and a valid comparison before any separately authorized research.
Do not delete protections	Do not eliminate required teaching support, privacy, safety, accessibility or legal duties to force margin improvement. Do not count allocated fixed overhead as an incremental cash saving or double-count studio/acquisition reductions.

Evidence | Originator framework, not efficacy proof

Selected written pages refreshed13November2026. All five are the originators site, not independent case-study verification. No interactive signup, email submission or purchase.

Definition	https://www.blueoceanstrategy.com/what-is-blue-ocean-strategy/ - simultaneous differentiation and low cost,new demand. Framework descriptions and reported study scope are not a universal success/permanent-no-competition guarantee.
Canvas	https://www.blueoceanstrategy.com/tools/strategy-canvas/ - competing factors, offering levels and profiles. Diagram not fully reviewed. This exercise uses a factor registry with units, not invented observed value curves.
ERRC	https://www.blueoceanstrategy.com/blog/errc-grid-template-examples/ - eliminate/reduce/raise/create. Flattened historical example grids lose category alignment;CitizenM occupancy/cost claims not independently verified/current or adopted as empirical proof.
Utility/price/cost	https://www.blueoceanstrategy.com/tools/value-innovation/ - align buyer utility,price and provider cost. No measured buyer utility or willingness-to-pay is supplied here;unit contribution is not all value innovation.
Noncustomer tiers	https://www.blueoceanstrategy.com/tools/three-tiers-of-noncustomers/ - edge/minimal buyers contemplating exit,conscious refusers,unexplored people who never considered category. Income,FD-saving or bus travel alone does not assign a tier.
Unresolved claims	No generic source here establishes historical IndiGo conversion from train/bus travel or early brokers converting FD savers. Category classification is not causal demand creation. Actual research needs allowed contact/data use,comparison,retention/outcomes/refunds/accessibility evidence and separate authority.

Actual work | No empirical conversion or learner result

Record only performed, permission-cleared work. Blank does not imply no harm,zero results,reviewer acceptance or mastery.

Date/version	Actual question/response Source/as-is evidence	Target/strong objection	Cost/demand correction	Reviewer finding	Delayed transfer

Actual work remains blank. Record only what occurred: dates, reasoning, error/source/correction, strongest objection and a new delayed transfer. No invented learner results, sponsor acceptance, actual budget release or signed rights.

Failure log | Authored execution only

Observed native tests are added only after execution. Not actual learner mistakes, independent human audit, Excel/Sheets parity, real authority or overall 10/10.

Controlled test	Observed authored outcome
Baseline cost and monthly bridges	PASS:every saved baseline formula independently checked.
Changed costs/prices/counts/fixed	PASS:24changedsets plus restoration,including nonpositive slopes.
Fixed versus rate break-even	PASS:fixed350 versus rate333.333333/whole334 and capacity.
Classification/cohort consistency	PASS:category shares descriptive;invalid cohorts held.
Invalid unit/count/fixed isolation	PASS:unit/count/fixed invalidity with isolated registry.
Invalid rate/registry isolation	PASS:16invalidcases,rate/registry independent controls.
Broken critical outputs holds	PASS:6brokenreferences held or explicit calculation error.
Restoration/actual records blank	PASS:baseline restored,actual work blank.

Only the original synthetic course exercise at https://top1os.dev/ supplies the case figures. No new empirical reading, real participants, company records, Indian legal clearance, actual commitments or source completeness claimed.
